## **Useful Tools**

You may find the <u>Firmware Modification Kit</u> useful, as it allows you to extract a firmware image (\*.trx, \*.bin) file, and peruse its contents. This permits you to check to see if a recent modification that you made is present in the firmware file without installing it onto a test system, and also to modify a firmware image for which you don't have the source code.

## 64bit build systems

On an ubuntu server amd64 build system, the following error is emitted:

In function 'open',

inlined from 'collect\_execute' at .../toolchain\_build\_mipsel/gcc-3.4.6/gcc/collect2.c:1537: /usr/include/bits/fcntl2.h:51: error: call to '\_\_open\_missing\_mode' declared with attribute error: open with O\_CREAT in second argument needs 3 arguments

The fix is

- > /\* redir\_handle = open (redir, O\_WRONLY | O\_TRUNC | O\_CREAT); \*/
- > redir\_handle = open (redir, O\_WRONLY | O\_TRUNC | O\_CREAT, 0777);

The image builder, used by the hsmm-mesh build environment, also requires that the ia32-libs package be installed.
